Rifqi Ariansyah

Cybersecurity Developer

Portfolio: rifqi.apexsions.com · GitHub: github.com/Nueeva · Contact: rifqi.apexsions.com/contact

SUMMARY

Cybersecurity developer focused on penetration testing, security tooling, and building secure web applications. Founder and lead developer of Apexsions, a production Minecraft server system built and operated end to end. Full-stack developer of Portfolio 71, the student portfolio platform of SMKN 71 Jakarta. Author of the open-source xssscope reflected-XSS scanner and CTF-Toolkit.

CORE SKILLS

Security: Penetration Testing · Vulnerability Assessment · Web Application Security · Network Security · Secure Code Review · Threat Modeling · OSINT

Development: TypeScript · React · Python · Java · Node.js · Go · Bash · Laravel · Nuxt

Tools: Burp Suite · Wireshark · Nmap · OWASP ZAP · Metasploit · Ghidra · sqlmap · Hashcat

SELECTED PROJECTS

Apexsions — A Full Minecraft Server System

Founder & Lead Developer — System Architect & Operator

- Nine-plugin Paper suite written in Java (Core, Economy, Chat, Shop, Crates, Battlepass, CustomEnchants, Fishing, Media) on a shared core library; Azuriom community website joined to the game through a custom two-way bridge (REST API and account linking).
- Led a full security audit that fixed 13 critical and 19 major findings — including a money-duplication flaw and a live API key committed to the repository — across 16 commits via a merged pull request with regression tests.
- Consolidated 28 duplicated files (approx. 5,300 lines) into ApexsionsCore. Production runs across two hosts with 11 plugins enabled and 0 disabled, and survived a PostgreSQL outage through a live fallback to SQLite (schema migrations V1–V7); 14 of 14 end-to-end scenarios pass.

Portfolio 71 — Student Portfolio Platform (SMKN 71 Jakarta)

Full-Stack Developer

- Laravel REST API (Sanctum authentication, role-based access for students, teachers, and admins) with a Nuxt frontend, running in production behind a Cloudflare Tunnel.
- Built a structured, tiered, AI-assisted verification workflow so teachers review project submissions as a workflow, not ad-hoc files; public student profiles with QR codes and share links; one-click, ATS-friendly CV PDF export generated from profile data.
- Production hardening shipped as part of the platform: authorization checks on sensitive endpoints and patching of critical PHP CVEs.

xssscope — Reflected XSS Scanner

Designer & Developer (solo)

- Zero-dependency JavaScript scanner that probes URL parameters for reflected XSS, classifies the reflection context of each finding, and verifies results automatically.

CTF-Toolkit

Creator & Maintainer

- Personal Python toolkit bundling the recurring helpers for common CTF categories — web exploitation, cryptography, forensics, and reverse engineering — so the workflow is ready before a competition starts.
